Microservices, Containers and Kubernetes in 10 minutes A lot of Kubernetes-versus-Docker debates have roots in the basics, such as the implementation of storage stack and networking. Both Docker and Kubernetes like to do things differently. A container needs a lot more than just a CPU and some memory to be useful. Kubernetes vs. Docker: A Primer - Container Journal A fundamental difference between Kubernetes and Docker is that Kubernetes is meant to run across a cluster while Docker runs on a single node. Kubernetes is more extensive than Docker Swarm and is meant to coordinate clusters of nodes at scale in production in an efficient manner.
